

## Fixing Instructions

### TILELINE EAVES VENTILATION SYSTEM.

The Dreadnought Tileline Eaves Pack can be used with or without a soffit detail and is suitable for use with rafter centres from 350mm to 600mm.

1. Locate or cut fascia board 15mm below the standard position for 10mm pack and 25mm below the standard position for a 25mmpack.
2. Fix the fascia ventilator along the top edge of the fascia board, each with four aluminium nails through the slots.
3. Fix the eaves ventilators centrally between each rafter and onto the wall plate with two galvanised clout head felt nails.
4. Lay tilting fillet.
5. Felt and batten the roof in the normal manner.
6. Fix the gutter bracket spacers in the required positions behind the gutter brackets. The top of the spacers will locate into the fascia ventilators (the spacers ensure an unrestricted air flow behind the gutter into the ventilator).
